## Black body

Flux and luminosity of a black body

$$
\begin{equation*}
F=\sigma T^{4} \quad L=4 \pi R^{2} \sigma T^{4} \tag{1}
\end{equation*}
$$

Magnitude system
The flux $f_{F}\left(\operatorname{erg} \sec ^{-1} \mathrm{~cm}^{-2}\right)$ passing through filter $F$ with a response $A_{F}(\lambda)$ (fraction transmitted [i.e., 0-1] at wavelength $\lambda$ ), and the absolute flux $f$, are:

$$
\begin{equation*}
f_{F}=\int f_{\lambda} A_{\lambda}(\lambda) d \lambda \quad f=\int f_{\lambda} d \lambda \tag{2}
\end{equation*}
$$

(note: with index $F=$ filter specific, without index $=$ bolometric).
Standard filters centered around $\lambda_{U} \approx 3650 \AA, \lambda_{B} \approx 4400 \AA, \lambda_{V} \approx 5480 \AA$, Definition of magnitudes/bolometric magnitudes:

$$
\begin{equation*}
m_{F, 1}-m_{F, 2}=-2.5 \log _{10}\left(\frac{f_{F, 1}}{f_{F, 2}}\right) \quad m_{1}-m_{2}=-2.5 \log _{10}\left(\frac{f_{1}}{f_{2}}\right) \tag{3}
\end{equation*}
$$

Normalization: $m=0$ and $m_{F}=0$ for the star Vega. Also, $m_{\odot}=-26.83, m_{\text {Sirius }}=-1.6$ Sensitivity of the eye: $m \lesssim 6$. With normalization, the magnitudes through standard filters are:

$$
\begin{equation*}
m_{X}=-2.5 \log _{10}\left[\frac{\int f_{\lambda}(\lambda) A_{X}(\lambda) d \lambda}{F_{X, \lambda 0} \int A_{X}(\lambda) d \lambda}\right] \quad m=-2.5 \log _{10}\left[\frac{\int f_{\lambda}(\lambda) d \lambda}{F_{0}}\right] \tag{4}
\end{equation*}
$$

where $F_{X, \lambda 0}=F_{\{U, B, V, R \text { or } I\}, \lambda 0}=\{4.27,6.61,3.64,1.74,0.832\} \times 10^{-9} \mathrm{erg} \mathrm{cm}^{-2} \mathrm{~s}^{-1} \AA^{-1}$, and $F_{0}=2.52 \times 10^{-5} \mathrm{erg} \mathrm{cm}^{-2} \mathrm{~s}^{-1}$ are the normalization fluxes.

Absolute magnitude: $M=m$ for $\star$ at $d=10 \mathrm{pc}$, i.e.,

$$
\begin{equation*}
M=m-5 \log _{10}\left(\frac{d}{10 p c}\right) . \tag{5}
\end{equation*}
$$

Absolute bolometric magnitude $M_{b o l} \equiv M=$ mag. of total luminosity. $M_{b o l, \odot}=4.76$.
Effective temperature $T_{\text {eff }}$ : Temperature which gives $L$.
"Color": $B-V \equiv m_{B}-m_{V}=$ color index
Wien approximation for blackbody: $f \propto \exp (h c / \lambda k T)$ (at short wavelengths), giving:

$$
\begin{equation*}
B-V \approx \frac{2.5 h c \log _{10} e}{k T_{c}}\left(\frac{1}{\lambda_{B}}-\frac{1}{\lambda_{V}}\right)+\text { const } \approx \frac{7090}{T_{c}}-0.71 \tag{6}
\end{equation*}
$$

For Vega, $B-V \equiv 0$, and $T_{c} \approx 10,000^{\circ} \mathrm{K}$.
Spectral Types From hot $\left(\sim 50000^{\circ} \mathrm{K}\right)$ to cold $\left(\sim 3000^{\circ} \mathrm{K}\right)$ : OBAFGKM. Each type goes from 0 to 9. (e.g., A0..A9). Sun is a G2 star.
HR Diagram: Absolute luminosity vs. Spectral Type. Other possibility: Absolute luminosity vs. B-V. (Color magnitude diagram).

Potential Energy and Virial theorem
Gravitational potential energy of spherically symmetric mass $M$ :

$$
\begin{equation*}
U_{\text {grav }}=-G \int_{0}^{M} \frac{m d m}{r} \tag{7}
\end{equation*}
$$

Virial theorem:

$$
\begin{equation*}
\frac{1}{2} \frac{d^{2} I}{d t^{2}}=2 K+\sum_{i} \mathbf{F} \cdot \mathbf{r} \tag{8}
\end{equation*}
$$

where $I$ is the "spherical" moment of inertial: $I \equiv \sum_{i} m_{i} r_{i}^{2}$. $K$ is the kinetic energy of the system: $K \equiv \sum_{i} m_{i}\left(d \mathbf{r}_{i} / d t\right) \cdot \mathbf{r}_{i}$.
Particles in gravitational field:

$$
\begin{equation*}
\mathbf{F}_{i, j}=-\frac{G m_{i} m_{j}}{r_{i, j}^{3}}\left(\mathbf{r}_{i}-\mathbf{r}_{j}\right) \tag{9}
\end{equation*}
$$

And the virial theorem becomes (in steady state $\mathrm{d} / \mathrm{dt}=0$ ):

$$
\begin{equation*}
K=-\frac{1}{2} \sum_{\text {pairs }} F_{i j} \cdot\left(\mathbf{r}_{i}-\mathbf{r}_{j}\right)=\frac{1}{2} \sum_{\text {pairs }} \frac{G m_{i} m_{j}}{r_{i, j}}=\frac{1}{2} \int_{0}^{M} \frac{G m(r) d m}{r}=-\frac{\Omega}{2} \tag{10}
\end{equation*}
$$

Translational kinetic energy for nonrelativistic gas: $K=\int \frac{3}{2} P d V$.
Gas+Radiation Pressure In system with both gas and radiation pressure $P=P_{g}+P_{r}$, where $P_{g}=\left(N_{0} k / \mu\right) \rho_{T}$, and $P_{r}=\frac{1}{3} a T^{4}$ with $a=4 \sigma / c$. We define $\beta=P_{g} / P$ such that $P_{r}=(1-\beta) P$. The relation between pressure and density:

$$
\begin{equation*}
P=\left[\left(\frac{N_{0} k}{\mu}\right)^{4} \frac{3}{a} \frac{(1-\beta)}{\beta^{4}}\right]^{\frac{1}{3}} \rho^{\frac{4}{3}} \tag{11}
\end{equation*}
$$

Molecular Weight Molecular weight $\mu$ appearing in $P_{g}=\left(N_{0} k / \mu\right) \rho_{T}$ is the average weight of a particle in unit of the proton mass $m_{p}$. Given mass fractions $n_{j}$ for specie $j$ in the ionized plasma, the molecular weight is:

$$
\begin{equation*}
\mu=\frac{\sum_{j} n_{j} A_{j}}{\sum_{j} n_{j}\left(1+Z_{j}\right)} \tag{12}
\end{equation*}
$$

each specie as an atomic mass $A_{j}$ and total charge $Z_{j}$.
If one gram contains X gram of $\mathrm{H}, \mathrm{Y}$ gram of He and Z gram of the rest, one has:

$$
\begin{equation*}
\frac{1}{\mu} \approx 2 X+\frac{3}{4} Y+\underbrace{\left\langle\frac{(1+Z)}{A}\right\rangle}_{\approx 1 / 2} Z \tag{13}
\end{equation*}
$$

## White Dwarfs

Non-relativistic:
Degeneracy pressure:

$$
\begin{equation*}
P_{e, n r}=\left[\frac{1}{20}\left(\frac{3}{\pi}\right)^{2 / 3} \frac{h^{2}}{m_{e} m_{p}^{5 / 3} \mu_{e}^{5 / 3}}\right] \rho^{5 / 3} \tag{14}
\end{equation*}
$$

Result using polytropes:

$$
\begin{align*}
R & =\left(1.22 \times 10^{4} \mathrm{~km}\right)\left(\frac{\rho_{c}}{10^{6} g c m^{-3}}\right)^{-1 / 6}\left(\frac{\mu_{e}}{2}\right)^{-5 / 6}  \tag{15}\\
M & =\left(0.4964 M_{\odot}\right)\left(\frac{\rho_{c}}{10^{6} g m^{-3}}\right)^{1 / 2}\left(\frac{\mu_{e}}{2}\right)^{-5 / 2} \tag{16}
\end{align*}
$$

or

$$
\begin{equation*}
M=\left(0.7011 M_{\odot}\right)\left(R / 10^{4} k m\right)^{-3}\left(\mu_{e} / 2\right)^{-5} \tag{17}
\end{equation*}
$$

Relativistic:
Degeneracy pressure:

$$
\begin{equation*}
P_{e, r}=\left[\frac{1}{8} \frac{3}{\pi} \frac{h c}{m_{p}^{4 / 3} \mu_{e}^{4 / 3}}\right] \rho^{4 / 3} \tag{18}
\end{equation*}
$$

Result using polytropes:

$$
\begin{align*}
R & =\left(3.347 \times 10^{4} \mathrm{~km}\right)\left(\frac{\rho_{c}}{10^{6} g c m^{-3}}\right)^{-1 / 3}\left(\frac{\mu_{e}}{2}\right)^{-2 / 3}  \tag{19}\\
M & =\left(1.457 M_{\odot}\right)\left(\frac{2}{\mu_{e}}\right)^{2}=M_{C h}=3.10\left(\frac{\hbar c}{G}\right)^{3 / 2} \frac{1}{m_{p}^{2} \mu_{e}^{2}} \tag{20}
\end{align*}
$$

Equations for stellar structure
Integration of continuity equation (mass):

$$
\begin{equation*}
\frac{d m}{d r}=4 \pi r^{2} \rho \tag{21}
\end{equation*}
$$

Hydrostatic equation:

$$
\begin{equation*}
\frac{d P}{d r}=-\rho \frac{G m(r)}{r^{2}} \tag{22}
\end{equation*}
$$

Equation of state.

$$
\begin{equation*}
\text { Gas pressure : } \quad P_{g}=\frac{\rho k T}{\mu m_{p}} \quad \text { Radiation pressure : } \quad P_{r}=\frac{1}{3} a T^{4} \tag{23}
\end{equation*}
$$

Radiation Transfer:

$$
\begin{equation*}
\frac{d T}{d r}=-\frac{3 k_{m} \rho}{16 \pi a c r^{2} T^{3}} L \tag{24}
\end{equation*}
$$

and opacity law ( $\kappa_{m}$ absorption coefficient per unit mass, i.e., $\mathrm{cm}^{2} / \mathrm{gr}$ ):

$$
\begin{equation*}
\text { Thomson : } \quad \kappa_{m}=\frac{\sigma_{T}}{m_{p}}\left(\frac{X+1}{2}\right) \quad \text { Kramer : } \quad \kappa=\tilde{\kappa} \rho T^{-3.5} \tag{25}
\end{equation*}
$$

or Convective energy transfer (i.e., adiabatic gradient):

$$
\begin{equation*}
\left.\frac{d T}{d r}\right|_{\text {adiab }}=-\frac{g}{c_{p}}=-\frac{g \mu m_{p}}{k}\left(\frac{\gamma-1}{\gamma}\right) \tag{26}
\end{equation*}
$$

Condition for convection:

$$
\begin{equation*}
\frac{3}{16 \pi} \frac{\kappa_{m} \rho L(r)}{a c T^{3}}>\frac{G m(r) \mu m_{p}}{k}\left(\frac{\gamma-1}{\gamma}\right) \tag{27}
\end{equation*}
$$

Conservation of Energy:

$$
\begin{equation*}
\frac{d L}{d r}=4 \pi r^{2} \rho \epsilon \tag{28}
\end{equation*}
$$

Nuclear energy generation:

$$
\begin{equation*}
\epsilon \approx \tilde{\epsilon} \rho^{m} T^{n} \tag{29}
\end{equation*}
$$

For pp burning $m=1, n \approx 5$. For CNO burning $m=1, n \approx 20$. For $3 \alpha$ burning $m=2$, $n \approx 40$.
Polytropes
$\overline{\text { Polytropic }}$ approximation assumes star is described by continuity+hydrostatic+polytropic relation:

$$
\begin{equation*}
P=K \rho^{\gamma} \equiv K \rho^{(n+1) / n} \tag{30}
\end{equation*}
$$

In adiabatic gas: $\gamma=c_{p} / c_{V}$, In non-relativistic mono-atomic gas $\gamma=5 / 3, n=1.5$. In relativistic mono-atomic gas: gas $\gamma=4 / 3, n=3$. Eddington standard model: $n=3$.
Standard transformations to get Lane-Emden equation:

$$
\begin{equation*}
\rho=\lambda \phi^{n} ; r=\xi \ell ; \quad \ell \equiv\left[\frac{(n+1) K \lambda^{(1-n) / n}}{4 \pi G}\right]^{\frac{1}{2}} \tag{31}
\end{equation*}
$$

and the equation itself:

$$
\begin{equation*}
\frac{1}{\xi^{2}} \frac{d}{d \xi}\left(\xi^{2} \frac{d \phi}{d \xi}\right)=-\phi^{n} \tag{32}
\end{equation*}
$$

with boundary conditions: $\phi(0)=1$ (thus $\left.\left.\lambda=\rho_{c}\right), d \phi /\left.d \xi\right|_{( } \xi=0\right)=0$. Outer boundary (exists only for $n<5$ ), is $\phi\left(\xi_{1}\right)=0$.
Stellar radius, mass:

$$
\begin{equation*}
R_{\star}=\xi_{1} \ell=\left[\frac{(n+1) K}{4 \pi G}\right]^{\frac{1}{2}} \lambda^{(1-n) / 2 n} \xi_{1} \quad ; \quad M_{\star}=-4 \pi \ell^{3} \lambda \xi^{2} \frac{d \phi}{d \xi} \tag{33}
\end{equation*}
$$

Average density and central pressure::

$$
\begin{equation*}
\frac{\bar{\rho}}{\rho_{c}}=-\frac{3}{\xi_{1}} \frac{d \phi}{d \xi_{\xi=\xi_{1}}} \quad ; \quad p_{c}=\left(K \lambda^{(1-n) / n}\right) \lambda^{2}=\frac{4 \pi R^{2} G}{(n+1) \xi_{1}^{2}} \lambda^{2} \tag{34}
\end{equation*}
$$

| $n$ |  | $\xi_{1}$ | $-\xi_{1}{ }^{2}\left(\frac{d \phi}{d \xi}\right)_{\xi-\xi_{1}}$ |
| :--- | :---: | :---: | :---: |
| 0 | 2.4494 | 4.8988 | $\frac{\rho_{c}}{\bar{\rho}}$ |

## Homologous solutions

$\overline{\text { Gas pressure dominated, homologous stars with radiation transfer satisfy: }}$

$$
\begin{align*}
& \frac{R_{2}}{R_{1}} \approx\left(\frac{\tilde{\epsilon}_{2} \tilde{\kappa}_{2}}{\tilde{\epsilon}_{1} \tilde{\kappa}_{1}}\right)^{\frac{2}{2 n+5}}\left(\frac{\tilde{\mu}_{2}}{\tilde{\mu}_{1}}\right)^{\frac{2 n-15}{2 n+5}}\left(\frac{M_{2}}{M_{1}}\right)^{\frac{2 n-7}{2 n+5}}  \tag{35}\\
& \frac{L_{2}}{L_{1}} \approx\left(\frac{\tilde{\epsilon}_{2}}{\tilde{\epsilon}_{1}}\right)^{\frac{-1}{2 n+5}}\left(\frac{\tilde{\kappa}_{2}}{\tilde{\kappa}_{1}}\right)^{-\frac{2 n+6}{2 n+5}}\left(\frac{\tilde{\mu}_{2}}{\tilde{\mu}_{1}}\right)^{\frac{14 n+45}{2 n+5}}\left(\frac{M_{2}}{M_{1}}\right)^{\frac{10 n+31}{2 n+5}} \tag{36}
\end{align*}
$$

Nuclear Reactions Reaction rate for reaction $a+X \rightarrow Y+b+Q$ is:

$$
\begin{equation*}
r_{a X}=\frac{1}{\left(1+\delta_{a} X\right)} \frac{\rho^{2} N_{A}^{2} X_{a} X_{X}}{A_{a} A_{X}}\langle\sigma v\rangle \tag{37}
\end{equation*}
$$

with $X_{i}$ and $A_{i}$, the mass fractions and atomic weight of specie $i$, and

$$
\begin{equation*}
\langle\sigma v\rangle=\left(\frac{8}{\mu \pi}\right)^{1 / 2} \frac{1}{(k T)^{3 / 2}} \int_{0}^{\infty} S(E) e^{[-E / k T-b / \sqrt{E]}} d E \tag{38}
\end{equation*}
$$

$S(E)$ is generally a slowly varying function of $E$ which depends on the reaction. The Gamow Peak is:

$$
\begin{equation*}
E_{0}=\left(\frac{b k T}{2}\right)^{2 / 3}=1.2\left(Z_{a}^{2} Z_{X}^{2} A_{\text {red }} T_{6}^{2}\right)^{1 / 3} \mathrm{keV} \tag{39}
\end{equation*}
$$

For $S(E)=S_{0}=$ const, one obtaines:

$$
\begin{equation*}
r_{a x}=\frac{n_{a} n_{x}}{A_{r e d} Z_{a} Z_{x}} 7 \times 10^{-19} S_{0}[k e V \text { barn }] \tau^{2} \exp (-\tau) s^{-1} \mathrm{~cm}^{-3} \tag{40}
\end{equation*}
$$

with $A_{\text {red }}$ the reduced atomic weight and

$$
\begin{equation*}
\tau \equiv \frac{3 E_{0}}{k T}=42.5\left(\frac{Z_{a}^{2} Z_{x}^{2} A_{r e d}}{T / 10^{60} K}\right)^{1 / 3} \tag{41}
\end{equation*}
$$

PP Chain:

CNO Cycle:

$$
\begin{array}{llll}

\end{array}
$$

$3 \alpha$ burning:

$$
\begin{aligned}
& { }^{4} \mathrm{He}+{ }^{4} \mathrm{He} \rightarrow{ }^{8} \mathrm{Be}-22 \mathrm{keV} \\
& { }^{8} \mathrm{Be}+{ }^{4} \mathrm{He} \rightarrow{ }^{12} \mathrm{C}^{*}-282 \mathrm{keV} \\
& { }^{12} \mathrm{C}^{*} \rightarrow{ }^{12} \mathrm{C}+2 \gamma+0.66 \mathrm{MeV}
\end{aligned}
$$

Robertson-Walker Metric:

$$
\begin{equation*}
d s^{2}=(c d t)^{2}-R(t)^{2}\left[\frac{d r^{2}}{1-K r^{2}}+r^{2}\left(d \theta^{2}+\sin ^{2} \theta d \phi^{2}\right)\right] \tag{1}
\end{equation*}
$$

where $K=0, \pm 1$.
Friedmann Equations:

$$
\begin{align*}
\ddot{R} & =-\frac{4}{3}\left(\rho+3 \frac{p}{c^{2}}+\frac{\Lambda}{3}\right) R  \tag{2}\\
\dot{R}^{2} & =\frac{8}{3} \pi G \rho R^{2}-K c^{2}+\frac{\Lambda}{3} R^{2} \tag{3}
\end{align*}
$$

Cosmological parameters:

$$
\begin{align*}
H_{0} & =\left(\frac{\dot{R}}{R}\right)_{0}  \tag{4}\\
\Omega_{0} & =\left(\frac{\rho}{\rho_{c}}\right)_{0}  \tag{5}\\
\rho_{c} & =\frac{3 H_{0}^{2}}{8 \pi G}  \tag{6}\\
q_{0} & =-\left(\frac{\ddot{R} R}{\dot{R}^{2}}\right)_{0} \tag{7}
\end{align*}
$$

Sound speed:

$$
\begin{equation*}
v_{s}^{2}=\left(\frac{\partial p}{\partial \rho}\right) \tag{8}
\end{equation*}
$$

'Cosmological' equation of state:

$$
\begin{equation*}
p=w \rho c^{2} \tag{9}
\end{equation*}
$$

Hydrodynamics equations:

$$
\begin{align*}
& \frac{\partial \rho}{\partial t}+\nabla \cdot(\rho \vec{v})=0  \tag{10}\\
& \frac{\partial \vec{v}}{\partial t}+(\vec{v} \cdot \nabla) \vec{v}=-\frac{1}{\rho} \nabla p-\nabla \phi \tag{11}
\end{align*}
$$

The joint probability distribution function of the primordial perturbation filed: $\delta\left(x_{1}\right), \delta\left(x_{2}\right), \ldots, \delta\left(x_{n}\right)$ :

$$
\begin{equation*}
P\left[\delta_{1}, \ldots, \delta_{n}\right]=\frac{1}{(2 \pi)^{n} \sqrt{\operatorname{det}(\mathbf{R})}} \exp \left[-\frac{1}{2} \vec{v} R^{-1} \vec{v}^{\dagger}\right] \tag{12}
\end{equation*}
$$

where $\vec{\delta}=\left(\delta_{1}, \delta_{2}, \ldots, \delta_{n}\right)$ and $R_{i j}=<\delta\left(x_{i}\right) \delta\left(x_{j}\right)>=\xi\left(r_{i j}\right)$.
The power spectrum and the two point correlation function:

$$
\begin{equation*}
\xi(\vec{r})=\frac{1}{(2 \pi)^{3}} \int p(\vec{k}) \exp [-\imath \vec{k} \cdot \vec{r}] \mathrm{d}^{3} k \tag{13}
\end{equation*}
$$

Black-body radiation:

$$
\begin{align*}
e & =\frac{4 \sigma}{c} T^{4}  \tag{14}\\
p & =\frac{1}{3} e  \tag{15}\\
n & =0.244\left(\frac{T}{\hbar c}\right)^{3} \mathrm{~cm}^{-3} \tag{16}
\end{align*}
$$

where the Stefan-Boltzmann constant is $\sigma=5.67 \times 10^{-5} \frac{\mathrm{~g}}{\mathrm{~s}^{3} \operatorname{deg}^{4}}, e, p, n$ are the energy density, pressure and number density of the photons.

Red-shift:

$$
\begin{equation*}
1+z=\frac{\lambda_{\mathrm{obs}}}{\lambda_{\mathrm{emitted}}} \tag{17}
\end{equation*}
$$

Critical density:

$$
\begin{equation*}
\rho_{c}=\frac{3 H_{0}^{2}}{8 \pi G} \tag{18}
\end{equation*}
$$

Fundamental constants:

$$
\begin{align*}
G & =6.67 \times 10^{-8} \mathrm{~cm}^{3} \mathrm{~g}^{-1} \mathrm{~s}^{-2}  \tag{19}\\
\hbar & =1.05 \times 10^{-27} \mathrm{erg} \mathrm{~s} \tag{20}
\end{align*}
$$
